

Tips for Applying Control Case Skins

1. Clean top surface of the control case with alcohol or damp cloth to remove any grease or dirt and thoroughly dry surface before applying the decal skin.
2. Apply each section of the skin one at a time, making sure you like the alignment. You will be able to remove and reposition initially. Once the decal position is just right, press down the section including all edges. (Pro tip: Use a Q-tip cotton swab to rub in all the small corners and edges and rub out any air bubbles or wrinkles)
3. Ideally, let the decal set up and let the adhesive take hold for 24 hours before using the case.
